Sudoku

1. Problem

Write a program to solve any given easy to medium difficulty level Sudoku puzzle.

2. Play the game

If you have not solved a Sudoku puzzle you can go to <u>sudoku9x9.com</u> to solve one. You'll need to know how to solve any given puzzle before you can teach the computer how to solve it. <u>sudoku9x9.com</u> can also show you step by step how to solve it. You can also enter your own puzzle.

3. Here's an easy puzzle

		9	4				2
5			8		6		1
	6				9	4	5
1		3			5	6	
4	5	6	3				
8	1	2	6			3	
9			5	1	7		

Enter this puzzle into <u>sudoku9x9.com</u> and try to solve it, first on your own, and then with the solver for step by step instructions if you can't solve it.

Note that your program doesn't have to follow the given step by step instructions. This is just to give you an idea of how to solve the puzzle.

Step 1

3 7	3 78	9	4	3 5 7	1 3	3 6 78	78	2
5	23 4 7	4 7	8	23 7	6	3 79	79	1
23 7	6	1 78	12 7	23 7	9	3 78	4	5
2 7	2 789	78	12 79	2 4 6 7 8 9	12 4 8	123 45 789	12 5 789	3 4 789
1	2 789	3	2 79	2 4 7 8 9	5	2 4 789	6	4 789
4	5	6	3	2 789	12 8	12 789	12 789	789
3 6 7	3 4 7	45 7	2 9	23 4 89	23 4 8	12 456 789	12 5 789	46 789
8	1	2	6	4 9	4	45 79	3	4 7 9
9	3 4	4	5	1	7	2 4 6 8	2 8	4 6 8

Find all possible solutions for all the empty cells, i.e., cells with no solutions yet.

3 7	3 78	9	4	3 5 7	1 3	3 6 78	78	2	
5	23 4 7	4 7	8	23 7	6	3 79	79	1	
23 7	6	1 78	12 7	23 7	9	3 78	4	5	
2 7	2 789	78	12 79	2 4 6 7 8 9	12 4 8	123 45 789	12 5 789	3 4 789	
1	2 789	3	2 79	2 4 789	5	2 4 7 8 9	6	4 789	
4	5	6	3	2 7 8 9	12	12 789	1 2 7 8 9	789	
3 6 7	3 4 7	4 5	2 9	23 4 89	23 4 8	12 456 789	12 5 789	46 789	
8	1	2	б	4 9	4	45 79	3	4 7 9	
9	3 4	4	5	1	7	2 4 6 8	2 8	4 6 8	

Two different things to look for in all the possible solutions:

- If there's only one possible solution for a cell then that number is a solution for that cell. Ex. Cell row 8, column 2 contains only a 4, so 4 is a solution for that cell. – Naked Single
- 2) If a possible solution is the only number in the row, column, or quadrant, then that number is a solution for that cell. Ex. Cell row 6, column 2 contains the number 5 which is the only occurrence for that quadrant, so 5 is a solution for that cell. **Hidden Single**

After filling in the numbers 5 and 4 for the solutions for the two cells

3 7	3 78	9	4	3 5 7	1 3	3 6 78	78	2
5	23 4 7	4 7	8	23 7	6	3 79	79	1
23 7	6	1 78	12 7	23 7	9	3 78	4	5
2 7	2 789	78	12 79	2 4 6 7 8 9	12 4 8	123 45 789	12 5 789	3 4 7 8 9
1	2 789	3	2 79	2 4 789	5	2 4 789	6	4 789
4	5	6	3	2 789	12 8	12 789	12 789	789
3 6 7	3 4 7	5	2 9	23 4 89	23 4 8	12 456 789	12 5 789	46 789
8	1	2	6	4 9	4	45 79	3	4 7 9
9	3 4	4	5	1	7	2 4 6 8	2 8	46 8

Step 3

3 7	3 78	9	4	5 7	1 3	3 6 78	78	2
5	23 4 7	$\left(\begin{array}{c} \end{array} \right)$	8	23 7	6	3 7 9	79	1
23 7	6	1 78	12 7	23 7	9	3 78	4	5
2 7	2 789	78	12 79	2 4 6 7 8 9	12 4 8	123 45 789	12 5 789	3 4 789
1	2 789	3	2 79	2 4 7 8 9	5	2 4 789	6	4 789
4	5	6	3	2 789	12 8	12 789	12 789	789
3 6 7		5	2 9	23 4 89	23 4 8	12 46 789	12 789	46 789
8	1	2	6	4 9	4	45 79	3	4 79
9		4	5	1	7	2 6 8	2 8	68

Repeat from step 1 until no more changes. All the solutions should have been found (for easy puzzles).

This is the result from doing step 1 the second time around.

Notice the changes made for the possible solutions in the circled cells. There are now two cells with only one possible solution. Doing the above 3 steps should be sufficient to solve all the easy to medium difficulty level puzzles.

Here's the final solution for this puzzle.

3	8	9	4	5	1	6	7	2
5	4	7	8	2	6	3	9	1
2	6	1	7	3	9	8	4	5
7	9	8	1	6	2	4	5	3
1	2	3	9	4	5	7	6	8
4	5	6	3	7	8	1	2	9
6	7	5	2	8	3	9	1	4
8	1	2	6	9	4	5	3	7
9	3	4	5	1	7	2	8	6

4. Grading

 \mathbf{C} – If your program can only print out possible solutions but cannot solve a puzzle completely.

 \mathbf{B} – If your program can solve these two puzzles. They can be solved by searching for **Naked Singles** only.

Puzzl	e 1						
		9	4				2
5			8		6		1
	6				9	4	5
1		3			5	6	
4	5	6	3				
8	1	2	6			3	
9			5	1	7		

Puzzl	e 2							
7			5	4	6			
	6	4	1	3				
3		8			9		7	
9	7			5				
		1	4			2	6	
					8	9		
8				6		7	3	

Using only Naked Singles will get 81 solutions

Using only Naked Singles will get 81 solutions

A - If your program can solve these two puzzles. Need to search for both Naked Singles and Hidden Singles.

Puzzle 3

8	2	9		3			
6	7	8					
	8		7		1	6	
							8
9			5		7	4	
		4		5	6	9	7
	6	7	8			2	
		3	9		4		

Using only Naked Singles will get 41 solutions

	3		6		9	5		
		1						
2	9						3	
8						4		
5			2	1			7	
	1				5	6		
6	2	9	5		8			
			7	2	6			

Using only Naked Singles will get 25 solutions

5. Initial Template Code

What follows are the data structures for storing the puzzle data and the initial template for your program. In addition to the member functions listed, there'll probably be many more that you'll need to have.

It is very important that you understand how to access the data that represent the solutions and the possible solutions for each cell. Here are some examples:

		\sim						
3 7	3 78	9	4	5 7	1 3	3 6 78	78	2
5	23 4 7	4 7	8	23 7	6	3 79	79	1
23 7	6	1 78	12 7	23 7	9	3 78	4	-5
2	2	7.8	12	2 4 6 7 8 9	12 4 8	123 45 789	125	3 4 7 8 9
1	2 7 8 9	3	7 9	2 4 7 8 9	5	789 2 4 789	6	4 7 8 9
4	5	6	3	2 789	12 8	12 789	12 789	789
3 6 7	3 4 7	5	2 9	23 4 89	23 4 8	12 456 789	12 5 789	46 789
8	1	2	6	4 9	4	45 79	3	4 79
9	3 4	4	5	1	7	2 4 6 8	2 8	4 6 8

How do you assign the solution 9 to the red-circle cell?

board[0][2].solution = 9;

- How do you assign the possible solution 2 to the redsquare cell?

board[1][4].possible_solutions[2] = true;

How do you test if the number 3 is a possible solution in the red-square cell?

If (board[1][4].possible_solutions[3] == true) { // 3 is a possible solution

```

int main() {
    Sudoku s;
    s.CreatePuzzle();
    s.PrintBoard();
    s.SolvePuzzle();
}
```

6. GetQuadrantCells

Given a cell coordinate, how to find the cells in the quadrant to initialize the array CellsInQuadrant?

0,0	0,1	0,2	0,3	0,4	0,5	0,6	0,7	0,8
1,0	1,1	1,2	1,3	1,4	1,5	1,6	1,7	1,8
2,0	2,1	2,2	2,3	2,4	2,5	2,6	2,7	2,8
3,0	3,1	3,2	3,3	3,4	3,5	3,6	3,7	3,8
4,0	4,1	4,2	4,3	4,4	4,5	4,6	4,7	4,8
5,0	5,1	5,2	5,3	5,4	5,5	5,6	5,7	5,8
6,0	6,1	6,2	6,3	6,4	6,5	6,6	6,7	6,8
7,0	7,1	7,2	7,3	7,4	7,5	7,6	7,7	7,8
8,0	8,1	8,2	8,3	8,4	8,5	8,6	8,7	8,8

Notice that for both the row and column coordinates in each quadrant they are in the range 0-2, 3-5, or 6-8. Here are the steps:

- 1. Given either the row or column number, determine which range (0-2, 3-5, or 6-8) it is in.
- 2. Once you know which range it is in then you can determine the starting number for that range.
- 3. Knowing the starting number for the range, you can now get the remaining two numbers.

For example, given a 7, it is in the range 6-8, so the starting number is 6. Therefore the three numbers are 6, 7 and 8.

A very efficient and simple way to find the starting number for the range is just to do an integer division and multiplication, i.e. number/3*3.

For your project you DO NOT need to read any further.

However, you'll get BONUS POINTS if you attempt what is discussed next.

7. Here's a very difficult puzzle to solve

Note, for your final project your program does not need to be able to solve this puzzle.

8				1				
		2	5	6		4		
	3							2
7							9	
					8			
		3	4	2		6		
	9		8	5			6	
		5			1			
					3	8		

Start with the three steps for solving the easy puzzle.

8			3	1	2			6
1	7	2	5	6	9	4		
	3		7	8	4			2
7		8	1	3	6		9	
			9	7	8			
9	1	3	4	2	5	6		
	9	1	8	5	7		6	
	8	5			1			
		7			3	8		

After doing the three steps to solve the easy puzzle you'll end up with this, and the loop exits with no more solutions to be found.

Step 4

8	4 5	4 9	3	1	2	5 7 9	5 7	6
1	7	2	5	6	9	4	3 8	3 8
56	3	6 9	7	8	4	1 5 9	1 5	2
7	2 4 5	8	1	3	6	2 5	9	4 5
2 4 5 6	2 4 5 6	46	9	7	8	123 5	123 45	1 3 45
9	1	3	4	2	5	6	78	78
23 4	9	1	8	5	7	23	6	3 4
23 46	8	5	2 6	4 9	1	23 79	23 4 7	3 4 7 9
4 6	2 4 6	7	2 6	4 9	3	8	1 2 4 5	1 4 5

Step 5

			_					_
8	45	4 9	3	1	2	5 79	5 7	6
1	7	2	5	6	9	4	3 8	3 8
56	3	6 9	7	8	4	1 5 9	1 5	2
7	2 4 5	8	1	3	6	2 5	9	45
2 4 5 6	2 4 5 6	46	9	7	8	123 5	123 45	1 3 45
9	1	3	4	2	5	6	78	78
2 3	9	1	8	5	7	23	6	3 4
2 3 6	8	5	2 6	4 9	1	23 79	23 4 7	3 4 7 9
4 6	4 6	7	2 6		3	8	15	1 5

Two more new things to look for in all the possible solutions:

- Look for two cells with the only two numbers in either row, column, or quadrant. Cells (8,7) and (8,8) are the only cells in the quadrant that have the numbers 1 and 5. So 1 and 5 are the only possible solutions in these two cells. Naked Pair
- 2) Look for three cells with the only three numbers in either row, column, or quadrant. Cells (8,0), (8,1), and (8,3) have only the three numbers 2, 4 and 6 as possible solutions. So these three numbers are the only possible solutions in these three cells and cannot be possibilities for any other cells in that row. Naked Triplet

Update the possible solutions in the corresponding row, column or quadrant.

Step 6

Repeat from step 1, i.e., the steps for the easy solution.

Here's the final solution

8	5	4	3	1	2	9	7	6
1	7	2	5	6	9	4	3	8
6	3	9	7	8	4	5	1	2
7	4	8	1	3	6	2	9	5
5	2	6	9	7	8	1	4	3
9	1	3	4	2	5	6	8	7
2	9	1	8	5	7	3	6	4
3	8	5	6	4	1	7	2	9
4	6	7	2	9	3	8	5	1

8. Here's an even harder puzzle to solve

		6		1	9				3	7	6	8	1	9	4	2	5
	8								9	8	5	3	4	2	7	6	4
		4	5		7				1	2	4	5	6	7	9	8	3
						8		2	7	6	1	4	9	3	8	5	2
		9			6	3			4	5	9	2	8	6	3	31	7
2	3					6			2	3	8	1	7	5	6	4	9
6				2			9		6	1	3	7	2	4	5	9	8
			6	5					8	9	7	6	5	4	2	3	4
5			9				7		5	4	2	9	3	8	1	7	6

Naked Triplet

	C1	C2	C3	C4	C5	C6	C7	C8	C9	▲ Message Board ▼	
R1	3 7	2 5 7	6	3 4 8	1	9	2 4 5 7	23 45 8	3 45 8	(R6, C5) must be 7. - Hidden Single	•
